

# Flexbox properties

**align-items:** This property defines how the items are aligned along the cross axis of the container. The possible values are stretch (default), flex-start, flex-end, center, and baseline

# Flexbox properties

**flex-grow:** This property defines how much an item should grow relative to the other items in the container. The default value is 0, which means the item will not grow.

**flex-shrink:** This property defines how much an item should shrink relative to the other items in the container. The default value is 1, which means the item will shrink equally with the other items.

# Flexbox properties

**flex-basis:** This property defines the initial size of an item before any remaining space is distributed among the items. The default value is auto.

**flex:** This is a shorthand property for flex-grow, flex-shrink, and flex-basis.
