

Float in CSS

Let's say we have a container div with two child divs inside it. We want the first child div to be floated to the left and the second child div to be floated to the right. Here's how we can achieve this using the "float" property in CSS:

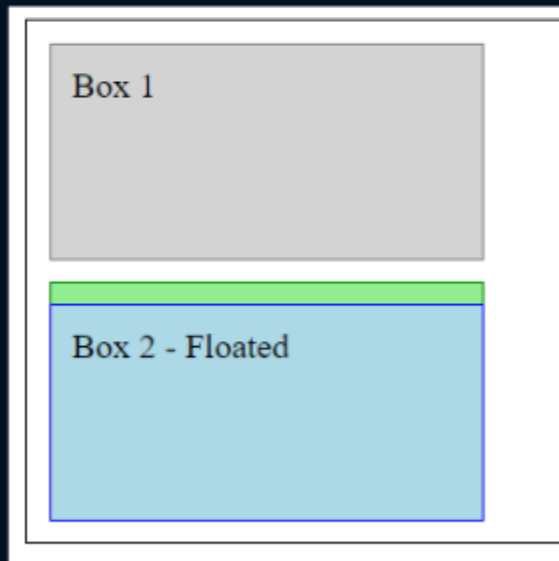

Without floating

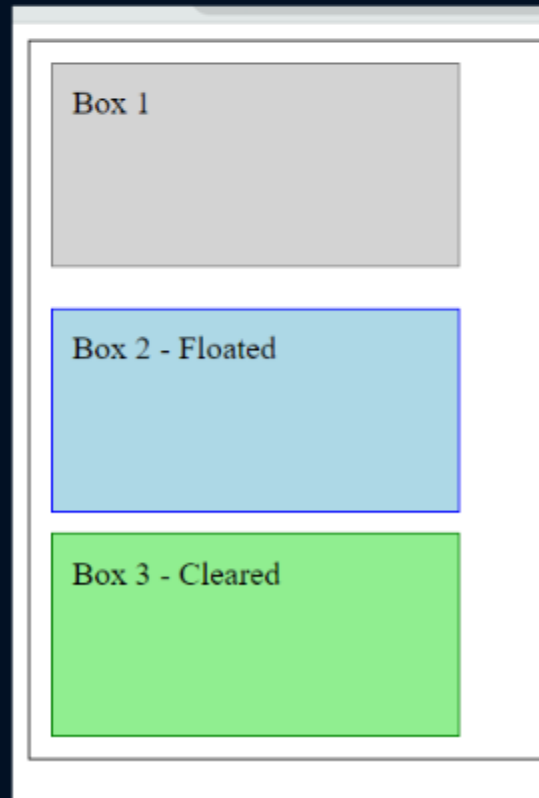

With floating

Clear in CSS

In CSS, "clear" is a property that is used to control how elements flow around a floated element. When an element is floated, other elements around it may wrap around it, which may not be desired. The "clear" property allows you to prevent this wrapping behavior by specifying where other elements should be cleared

Without clear
property
