

Attribute selectors

Attribute selectors are used to select elements that have a specific attribute or attribute value. For example, the following CSS selector selects all anchor tags with a title attribute:

```
a[title] {  
    /* Styles for anchors with title attribute */  
}
```

Attribute selectors

You can also use attribute selectors to target elements with a specific attribute value. For example, the following selector targets all input elements with the attribute `type="submit"`

```
input[type="submit"] {  
    /* Styles for submit buttons */  
}
```

nth-child pseudo-selector

The nth-child pseudo-selector allows you to select elements based on their position within a parent element. For example, you can use the following selector to target the first child element of a parent:

```
parent-selector :first-child {  
    /* Styles for first child element */  
}
```

nth-child pseudo-selector

You can also use the nth-child selector to target elements based on their position in the parent, such as the 3rd, 4th, or 5th child:

```
parent-selector :nth-child(3) {  
    /* Styles for third child element */  
}
```

```
parent-selector :nth-child(odd) {  
    /* Styles for odd child elements */  
}
```
