

Spanning

How to Spain column and row like this

grid-row

The grid-row property is similar to grid-column, but specifies placement within the container's rows. It accepts the same types of values as grid-column, and can also be combined with it to specify both the column and row placement of the grid item.

grid-column

The grid-column property specifies both the starting and ending points of a grid item's placement within the grid container's columns. It accepts a value of either a line number or a name of a grid line, or a combination of the two separated by a slash. For example, grid-column: 2 / 4 would place the grid item from the second grid line to the fourth grid line.
